

A CDM PERSPECTIVE ON COGENERATION IN SOUTH AFRICA

Alistair McMaster
PURE CARBON AFRICA

ESKOM definitions and classes of Cogeneration projects:

	Type 1	Type 2	Type 3
Definition	Projects utilizing process energy which would otherwise be underutilized or wasted.	Primary fuel based generation projects which produce, as part of their core design, other usable energy in addition to electricity.	Renewable fuel based projects, where the renewable fuel source is both (i) a primary source of energy used for generation and (ii) a co-product of an industrial process

- Type 1:
 - Projects utilizing waste heat from an industrial process as the primary energy source to generate electricity – Waste Heat Recovery Systems (“WHRS”); or
 - Projects utilizing waste or unused fuel, of a non-renewable nature, produced as a direct output of an underlying industrial process, as the primary energy source to generate electricity. e.g. projects burning waste flue gas to generate electricity

- Type 2
 - Primarily Combined Heat and Power (“CHP”) projects where in addition to electricity the project produces consumable heat e.g. projects producing process steam or district heating type projects.

- Type 3
 - Projects utilizing fibrous waste as the primary energy source to generate electricity e.g. bagasse from the sugar industry, or forestry waste from the paper and pulp industry
 - E.G. Tongaat Hulett - Felixton, Amatikulu and Maidstone Mills, producing 9MW.

- Type 3
 - Project utilizing solid renewable waste as the primary energy source to generate electricity

- ESKOM Pilot National Cogeneration Programme (PNCP) – suspended;
- Next Phase Cogeneration Programme – delayed until the commercial process for the PNCP has been concluded;
- REFIT PHASE II – generally excludes cogeneration.

The Clean Development Mechanism (CDM) is a GHG emission reduction trading scheme that is designed to improve the viability of projects, including cogeneration projects.

Carbon Trading is the Economic Mechanism for reducing GHG

pure

carbon services

Kyoto Protocol: Annex 1 countries have committed to limiting their GHG emissions in the 2008–2012 period to a specified percentage of 1990 emissions

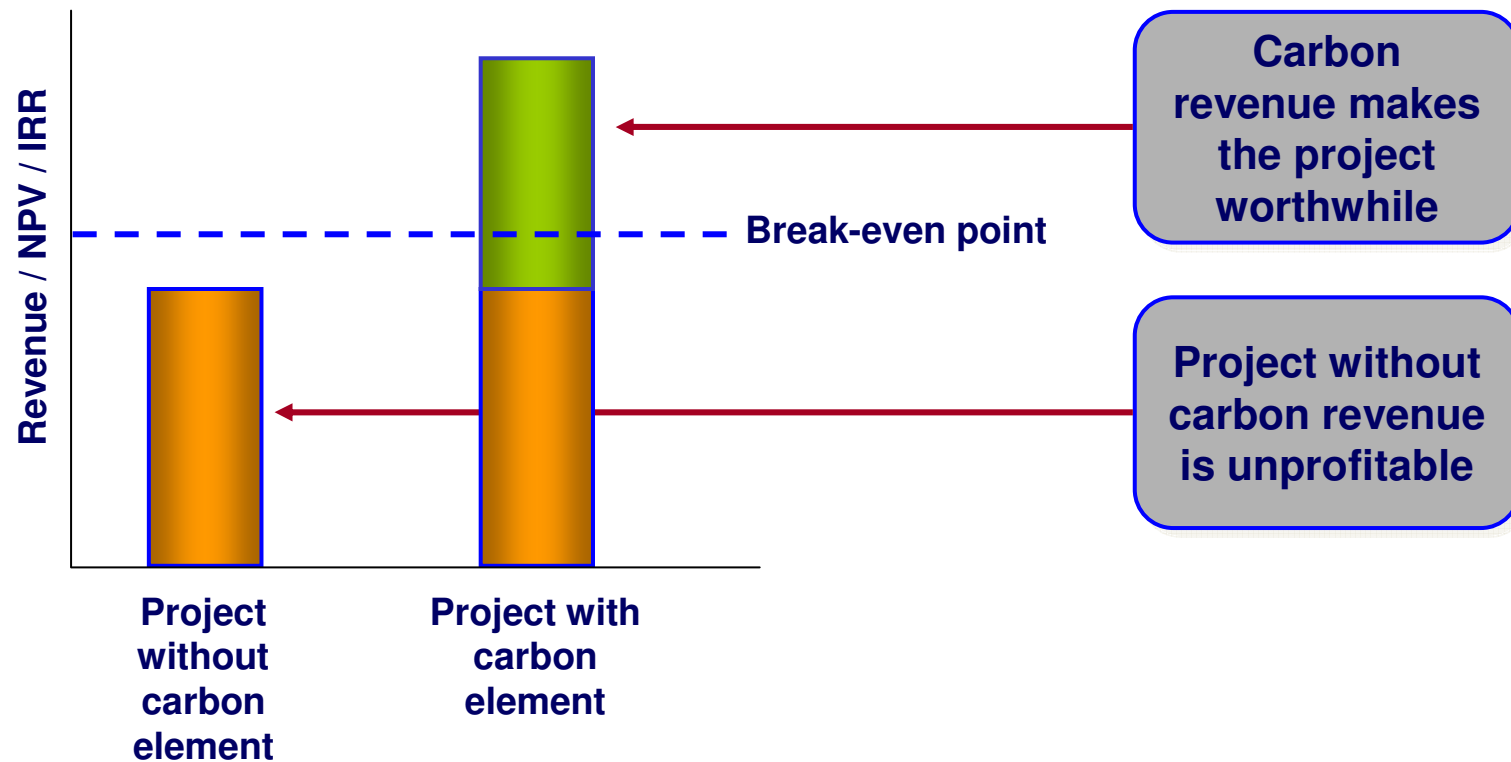

CDM ('Clean Development Mechanism') is an arrangement allowing industrialised countries to invest in emission reduction projects in developing countries as an alternative to more costly emission reductions at home.

CDM credits are called '**CERs**' and can be used to meet a country's cap

SA is signatory as a developing country

HOW DO CERs HELP PROJECTS?

CERs can fund between 10 to 40 % of project cost.

Carbon Credits are not some vast revenue stream, but rather they *can* be the cherry on top.

CDM Project Eligibility Criteria

1. **Additionality (from the start)**

1. Financial
2. Technological
3. Common Practice

2. **Sustainable Development**

3. **Methodology compliance**

1. Can a baseline be calculated?
2. Is there a methodology that is acceptable to the EB?
3. Can the departure from the baseline be measured and monitored.

4. **The project must be auditable**

5. **You CANNOT claim CERs as an afterthought**

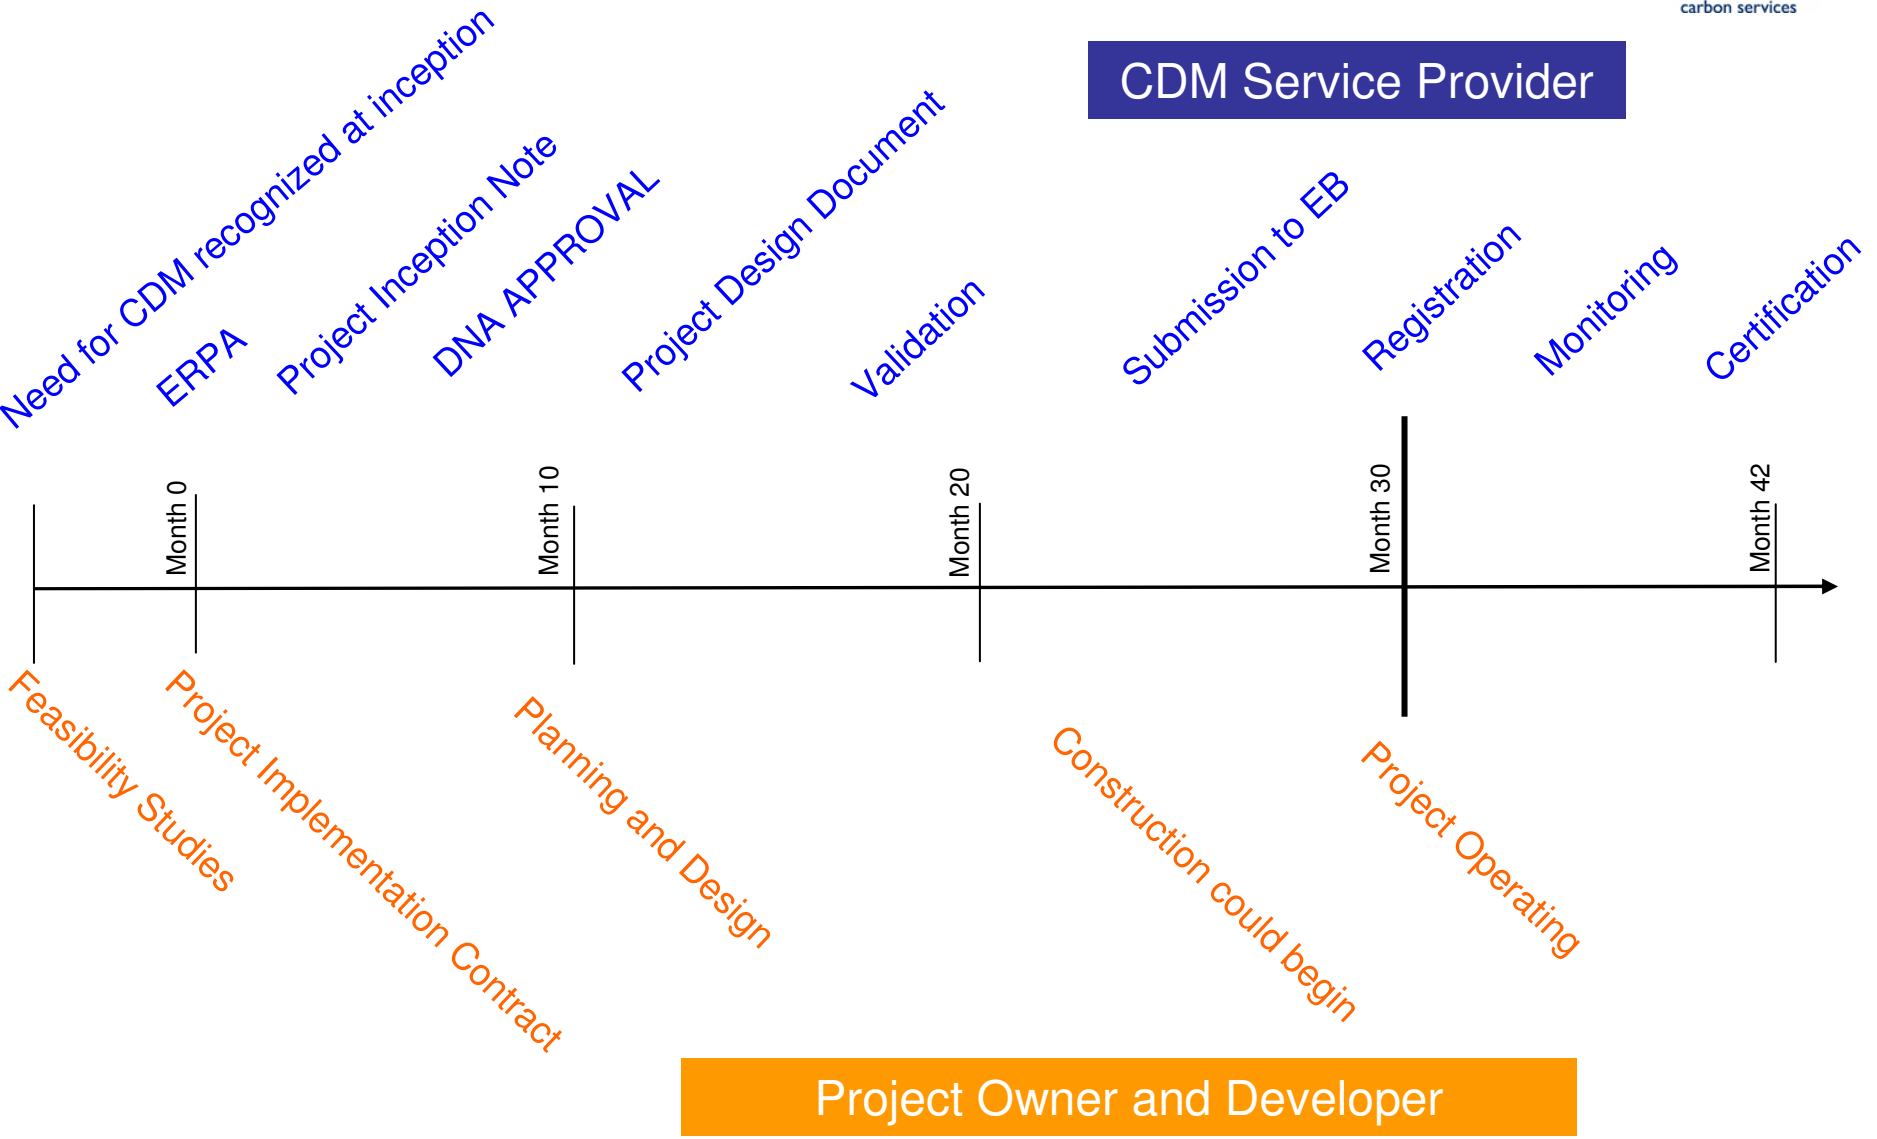

CDM Methodologies and Cogeneration (Large)

Type	Methodology Name	#
Biomass	Grid-connected electricity from biomass residues	276
Coal Bed Mine CH4	Coal bed methane and coal mine methane capture and use for power (electrical or motive) and heat/or destruction by flaring	74
EE	Waste gas recovery and utilization for power generation at cement plant	32
EE	Recovery and utilization of waste gas in refinery facilities	4
EE (Supply Side)	Conversion from single cycle to combined cycle power generation	13
EE (Supply Side)	Natural gas-based package cogeneration	40
Landfill	Landfill gas project activities	206

CDM Methodologies and Cogeneration (Small)

Type	Methodology Name	#
RE (Type 1)	A. Electricity generation by the user	31
RE (Type 1)	C. Thermal energy production with or without electricity	345
RE (Type 1)	D. Renewable electricity generation for a grid	1585
EE (Type 2)	B. Supply side energy efficiency improvements - generation	23

The CDM Project Timeline

IS CDM MAKING A DIFFERENCE?

CDM International Status (as at 01/2010)

Status of CDM projects	Number
At validation	2602
Request for registration	58
Request for review	70
Correction requested	71
Under review	37
Total in the process of registration	236

Comparative CDM performance: South Africa

CDM Projects per Billion US\$ GDP

2012 KCERs per billion US\$ GDP

Why so few cogeneration based CDM projects in South Africa?

- Technology Issues
- Financial Issues
- Institutional Issues
- Regulatory Issues
- EIAs
- Rigorous CDM Process
- Apart from renewable solid biomass, cogeneration has been excluded from REFIT I and II

- No CC gas/steam turbines manufactured in South Africa (?).
- To date most IC gas engines are imported, but:
 - Are expensive given current electricity prices
 - May not be appropriate for local conditions; and
 - After sales service and support can be an issue.
- Locally produced hardware has yet to reach maturity, but promising future (also expensive).
- Limited supporting technology (flaring systems, continuous monitoring systems, remote field stations) and few integrated modules.

Locally manufactured technology: CAE

Demonstration Project Piggery – Limpopo

- **Continuous operation**
- **Remote monitoring & control**
- **Potential of up to 500 kW**

Locally manufactured technology: CAE

pure

carbon services

Remote Monitoring and Control

Emergency alarm automatic shut down; 24/7 monitor and remote control

The screenshot displays a comprehensive remote monitoring and control interface for a CAE system. The interface is organized into several key sections:

- Left Panel:** A vertical list of status indicators for various components, including Ignition/Lambda (On), Gas (On), Coils/ Gas control (On), Starter (Off), Ventilation_Fan (On), Prime Solenoid (Off), -Ph_Socket/Coolant_Pump (On), Scrubber Pump (On), Eta_Override, and Eta_Reset. Below this is a 'Panel 15' section with indicators for Reset (Off), Over_Ride (Off), and three E-Stop buttons (E-Stop_CR, E-Stop_TC, E-Stop_Asc) all in the 'On' state.
- Top Section:** A row of tabs labeled 'Main', 'Setup', 'Dials', 'Graph', 'Actuators', and 'Scrubber'. The 'Main' tab is active.
- Temperature and Pressure Readings:** A central area displays several temperature and pressure values:
 - T_Cool_In: 68.4 °C
 - T_Cool_Out: 75.0 °C
 - T_Oil: 73.0 °C
 - T_Air_Engine Bay: 34.9 °C
 - T_Exh: 625.6 °C
 - T_Port_1: 585.8 °C
 - T_Port_2: 583.0 °C
 - T_Port_3: 566.1 °C
 - T_Port_4: 569.7 °C
 - T_Port_5: 578.0 °C
 - T_Port_6: 594.0 °C
 - P_Exh: 16 mBar
 - P_Oil: 6.3 Bar
 - P_Cool_In: 867 mBar
 - P_Cool_Out: 252 mBar
 - P_Baro: 1025 mBar
 - P_Manifold: 614 mBar
 - P_Gas: 15 mBar
 - P_Gas_Digester: 24 mBar
- Actuator and Voltage Readings:** A section on the right shows actuator and voltage levels:
 - Speed: 1520 rpm
 - Lambda: 1.09
 - Gas control valve: 29.29 %
 - Tps_Position: 39.59 %
 - Small Gen Batt Voltage: 0.15 VDC
 - Engine Battery Voltage: 27.51 VDC
 - ~AFR: 16.03
- Control Panels:** Several floating panels are visible, including:
 - Panel 9: P_Exh (16 mBar), P_Oil (6.3 Bar), P_Cool_In (867 mBar), P_Cool_Out (252 mBar), P_Baro (1025 mBar), P_Manifold (614 mBar), P_Gas (15 mBar), P_Gas_Digester (24 mBar).
 - Panel 26: ASCO_Speed_Setpoint (1500 rpm).
 - Panel 35: ~Power est (30 kW).
 - Panel 12: Speed* (01500 rpm) and T_Cool* (00075 °C).
- Test Cycle Progress:** A 'Stage Details' panel on the right shows a test cycle with steps 1 through 7. The current stage is 'Executing Stage' with a progress bar and time indicators (03:08:34 of 100:00:00).
- Status Bar:** The bottom of the interface features a status bar with various indicators (Critical Alarm, Warning Alarm, Engine Status, Online, Stage Logging, Manual Logging, Automated Test, Watchdog, Admin) and a message 'Undefined Save - 569 Data Points Saved'. It also includes a 'Dyno Timer' and 'Engine Timer' section.

Biomass Gasification for Cogeneration

Melani Biomass Gasification Project, UFHIT

- **First conceptualized among Eskom R&D, Eskom Development Foundation and UFHIT in 2000;**
- **System installed in 2007 by Carbo Consult (Pty) Ltd**
- **Situated at a sawmill in the Tyume River Valley, Eastern Cape**
- **Sawmill currently incinerates waste wood.**

System Specifications and Details

- No grid connection;
- Waiting for delivery of a package bakery and grain mill to be driven by gasification system;
- kWh cost of running the plant and recovering investment far exceeds the R1.18 REFIT II guide for biomass RE (although this project would not be eligible in first place)

- Public Finance
 - Highly bureaucratic and plenty of red tape;
 - Staff often have limited capacity to assess projects;
 - Problem complicated by high staff turnover, which often means that applications go back to square 1;
 - Each application must go through tiers of committees;
 - Decision by the agency can take up to two years.
- Private Finance:
 - More easily accessed, but high cost of borrowing.

- Issues around Power Purchase Agreements;
- No codes and standards for grid tie-in and transmission/wheeling agreements. Very poor enabling environment;
- Regulatory environment for Independent Power Producers is still in infancy; NERSA appears to be feeling its way;
- To date, Eskom has been both player and referee (Renewable Energy Purchasing Agency (REPA) housed in Eskom); and
- Electricity in South Africa has traditionally been cheap, while REFIT still to be rolled out.
- All eyes on Independent System Operator (ISO)

- NERSA permits IPPs to sell power directly to entities willing to buy renewable energy outside REFIT, provided that a generation license has been granted...
 - EIA – Record of Decision.
 - Power Purchase Agreement.
 - All other commercial agreements:
 - Fuel Supply Agreement (FSA);
 - Transmission Connection Agreement (TCA); and
 - Transmission Use of System Agreement (TUOSA).
 - Confirmation of inclusion in IRP/Ministerial approval for plant.
 - Financing arrangements.
 - Business Plan.

- National Environmental Management Act (1998).
- National Environmental Management: Air Quality Act (2004).
- National Environmental Management: Waste Management Act (2008).

- To date CDM has been a complex process which is difficult to navigate, and involves significant financial risk.
- 40% of applications are rejected after large amounts of money have been spent.
- Issuance is often not successful.
- Uncertainty about post 2012 means high financial risk.

- Enabling Environment Programme -
 - Develop feed-in tariffs for cogeneration (COFIT)
 - Facilitate appropriate power purchase agreements (PPA) for buyers and sellers
 - Assess grid access conditions
 - Facilitate the finalization of cost recovery mechanism rules
 - Facilitate the creation of an Independent System Operator (ISO)

Cleared Alien Invasives as Biomass Sources

- Total condensed invaded area in EC: 438,387 Ha (Versveld *et al*, 1998);
- Biomass value @ +/- 50 tons Ha = 21,919,350 tons;
- Roughly equal to 10,959,675MWh electricity;
- Heavy infestations in Kei, Kubusi, Mthatha, Mzimvubu, Mzimtlava, Kaneka, Bira, Keiskama;
- Strong opportunity for decentralised, rural off-grid renewable energy hubs with LED and job-creation benefits.
- Possibilities of CDM PoA
