

PEOPLES POWER AFRICA

CONVERTING WASTE INTO ENERGY

Logistics and supply chain considerations for bioenergy production

Draft of presentation to the
African Caribbean and Pacific Group of States (ACP)
Science and Technology Programme,
Sustainable non-food sources of oil

March 03, 2011

Outline of Presentation

This presentation will focus on feedstock supply and logistic issues relating to the following proposed facilities.

- Integrated Bioenergy and Resource Recovery Hub at 2nd Creek
- Central Anaerobic Digester at Queenstown
- Rural biomass CHP at Amabele

Integrated Bioenergy & Resource Recovery Hub at 2nd Creek

Processes: biogas digestion, biogas upgrading, biomass gasification, CHP composting and vermi-composting water reclamation.

Feedstock: wastewater, sewage sludge, OFMSW (food waste), abattoir waste and garden refuse.

Output of 2nd creek initiative

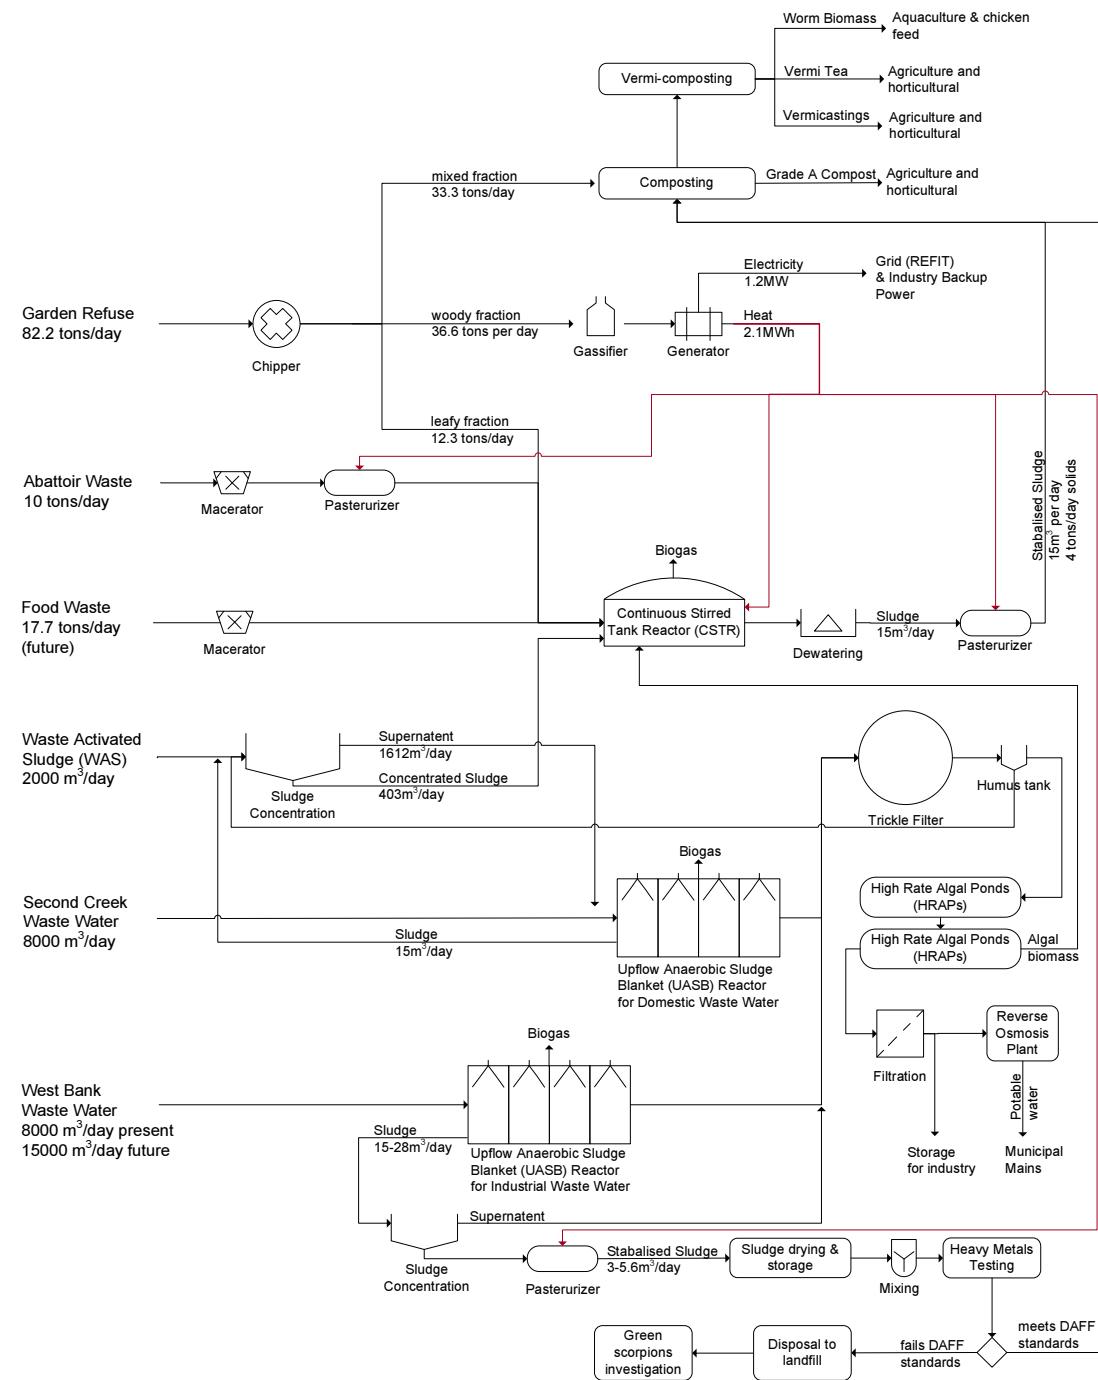

Feasible sustainable self funding business that:

- create over 70 direct jobs at the proposed 2nd creek facility;
- create over 120 indirect jobs in the upstream and downstream zerowaste sectors;
- divert over 30000 tons/year of waste from landfill;
- eliminate the unpermitted discharge of 10ML per day of untreated wastewater and sewage sludge into the surfzone at hoodpoint;
- generate over 1.35MWh green electricity capacity;
- generate 2200 tons/year of natural gas energy for use by local industry;
- generate over 5.8 billion litres/year of recycled water;
- produce biochar and vemicompost, compost and algal biofertilizer for agriculture.

Feedstock Supply & Logistics

- Industrial Wastewater: 10000m³ per day
- Residential Wastewater: 8000m³ per day
- Waste Activated Sludge 2000m³ per day
- Garden Refuse: 82 tons per day
- Food Waste: 17.5m³ per day source separated
(future option)

(Final Presentation to detail supply & logistics issues and costs of each)

Central Anaerobic Digester at Queenstown

Processes: biogas digestion, biogas upgrading, CHP, biofertilizer production

Feedstock: Sewage sludge, food waste, abattoir waste, piggery manure slurry.

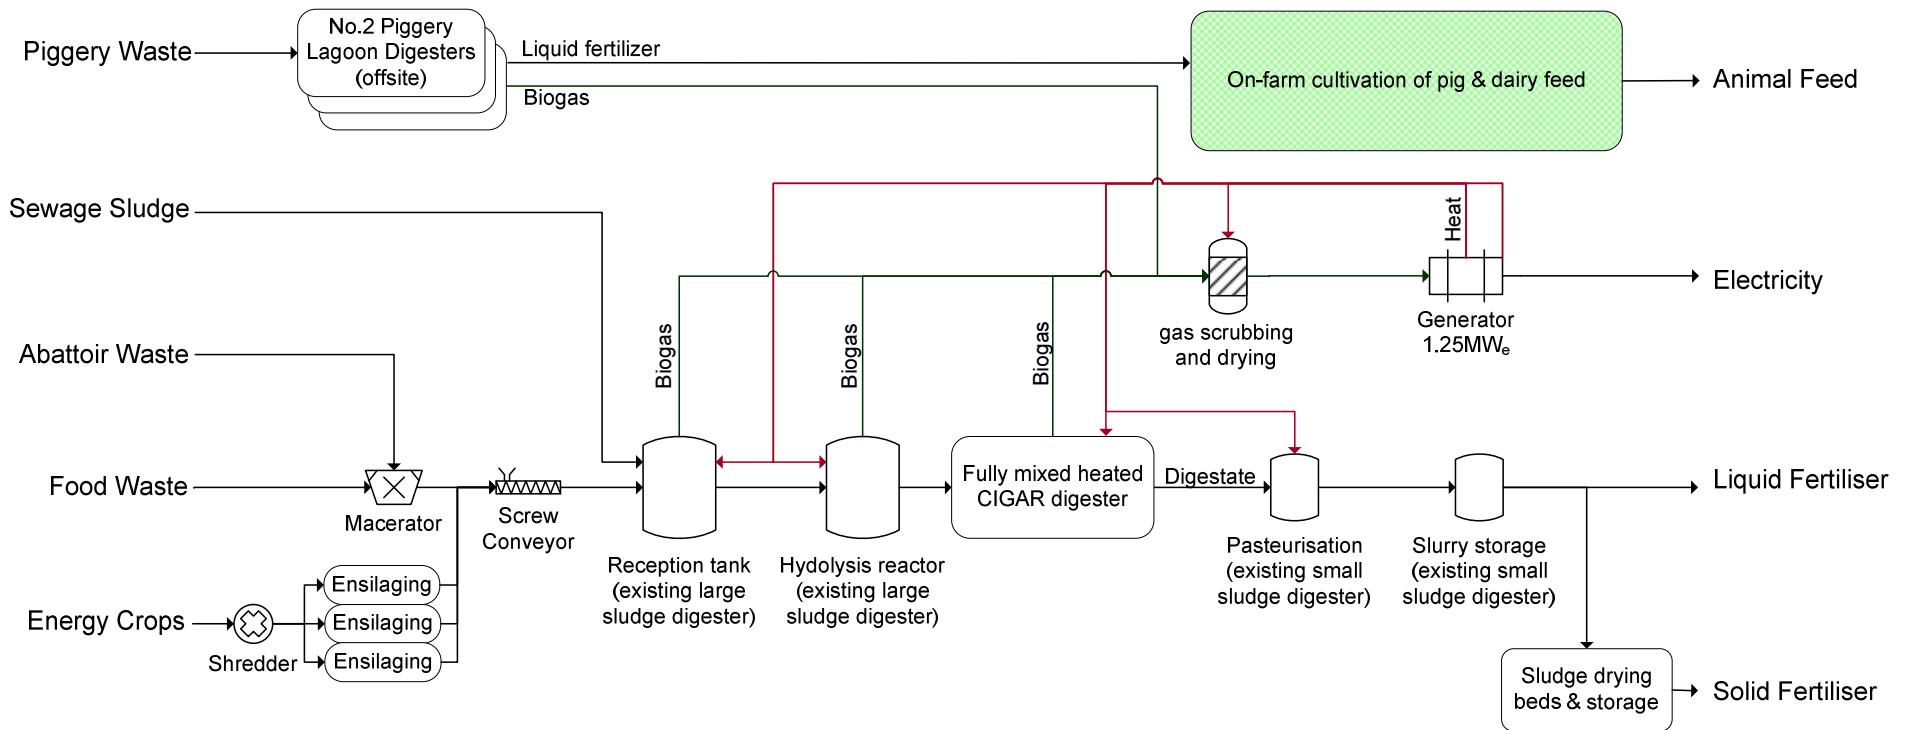

Output of Queenstown CAD

- creation of 10 direct jobs and over 70 jobs in the downstream dry waste recycling sector;
- 1.2MWh ‘green;’ electricity generation capacity;
- the abatement of 8526 tCO₂e of green house gases from the avoided Eskom coal fired power generation.
- the local production of over R1.6 million in biofertiliser to replace synthetic fertiliser imports;
- the reduction of valuable resource disposal to landfill & the associated the reduction in landfill airspace cost;
- the reduction of GHG emissions from landfill, existing uncapped, sewage sludge production, uncovered pig slurry ponds

Feedstock Supply & Logistics

- Sewage Sludge 242m³ per day
- Food Waste: 5.52 m³ per day (source separated)
- Abattoir waste: 10.75m³ per day
- Pigsty slurry: 280.9m³ per day
- Energy crops: 25.2m³ per day of ensilaged
sweetsorghum

(Final Presentation to detail supply & logistics
issues and costs of each)

Central Anaerobic Digester at Queenstown

Processes: biogas digestion, biogas upgrading, CHP, biofertilizer production

Feedstock: Sewage sludge, food waste, abattoir waste, piggery manure slurry.

Ensilaged Sweet Sorghum Feedstock Production

© 2010 AfriGIS (Pty) Ltd.

Rural Biomass CHP at Amabele

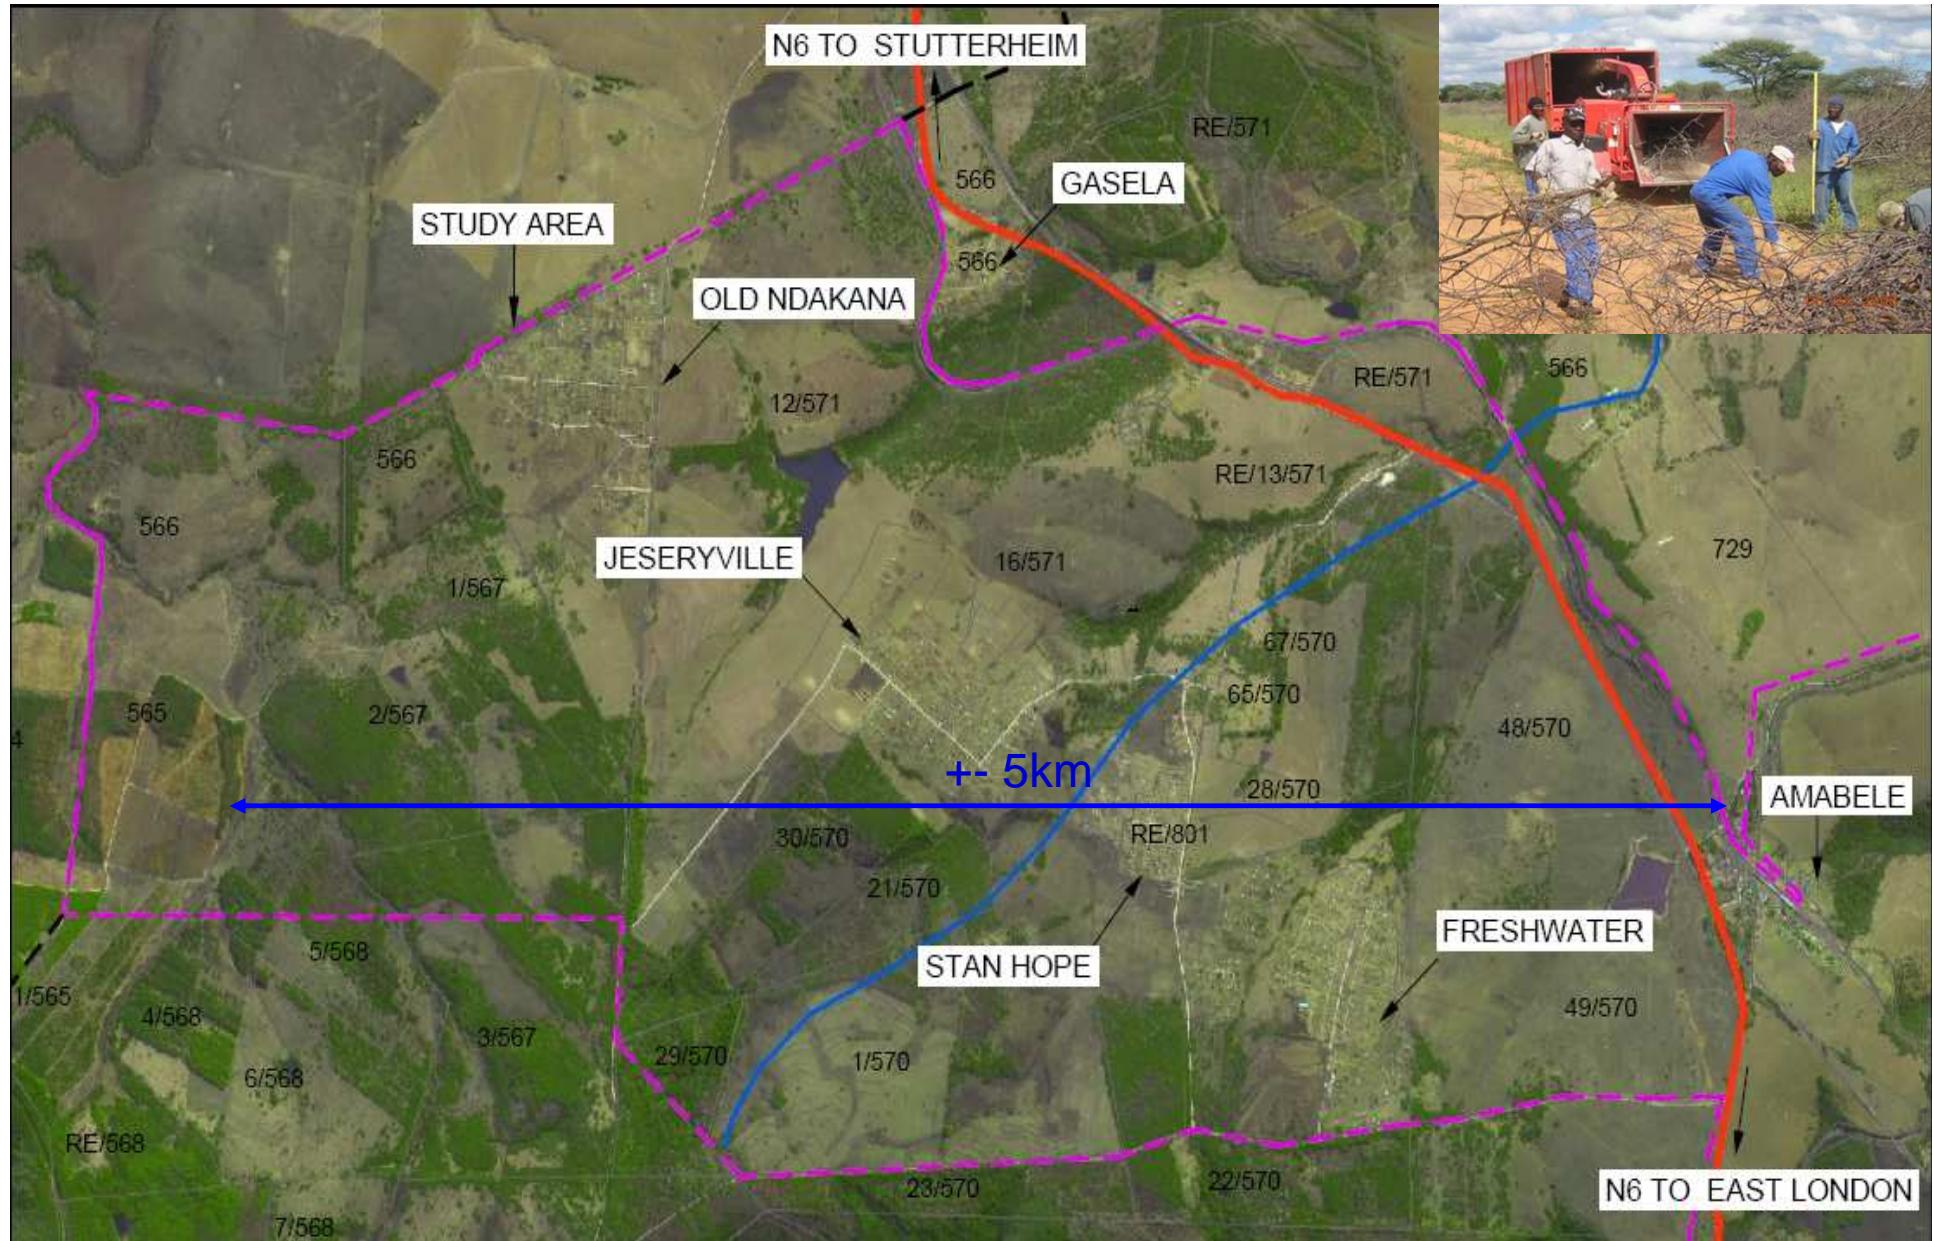

Processes: Clearing invasive wattle, forestry and bamboo plantation management, harvesting chipping, drying, gasification, CHP

Feedstock: Wattle, gum & bamboo from communal lands

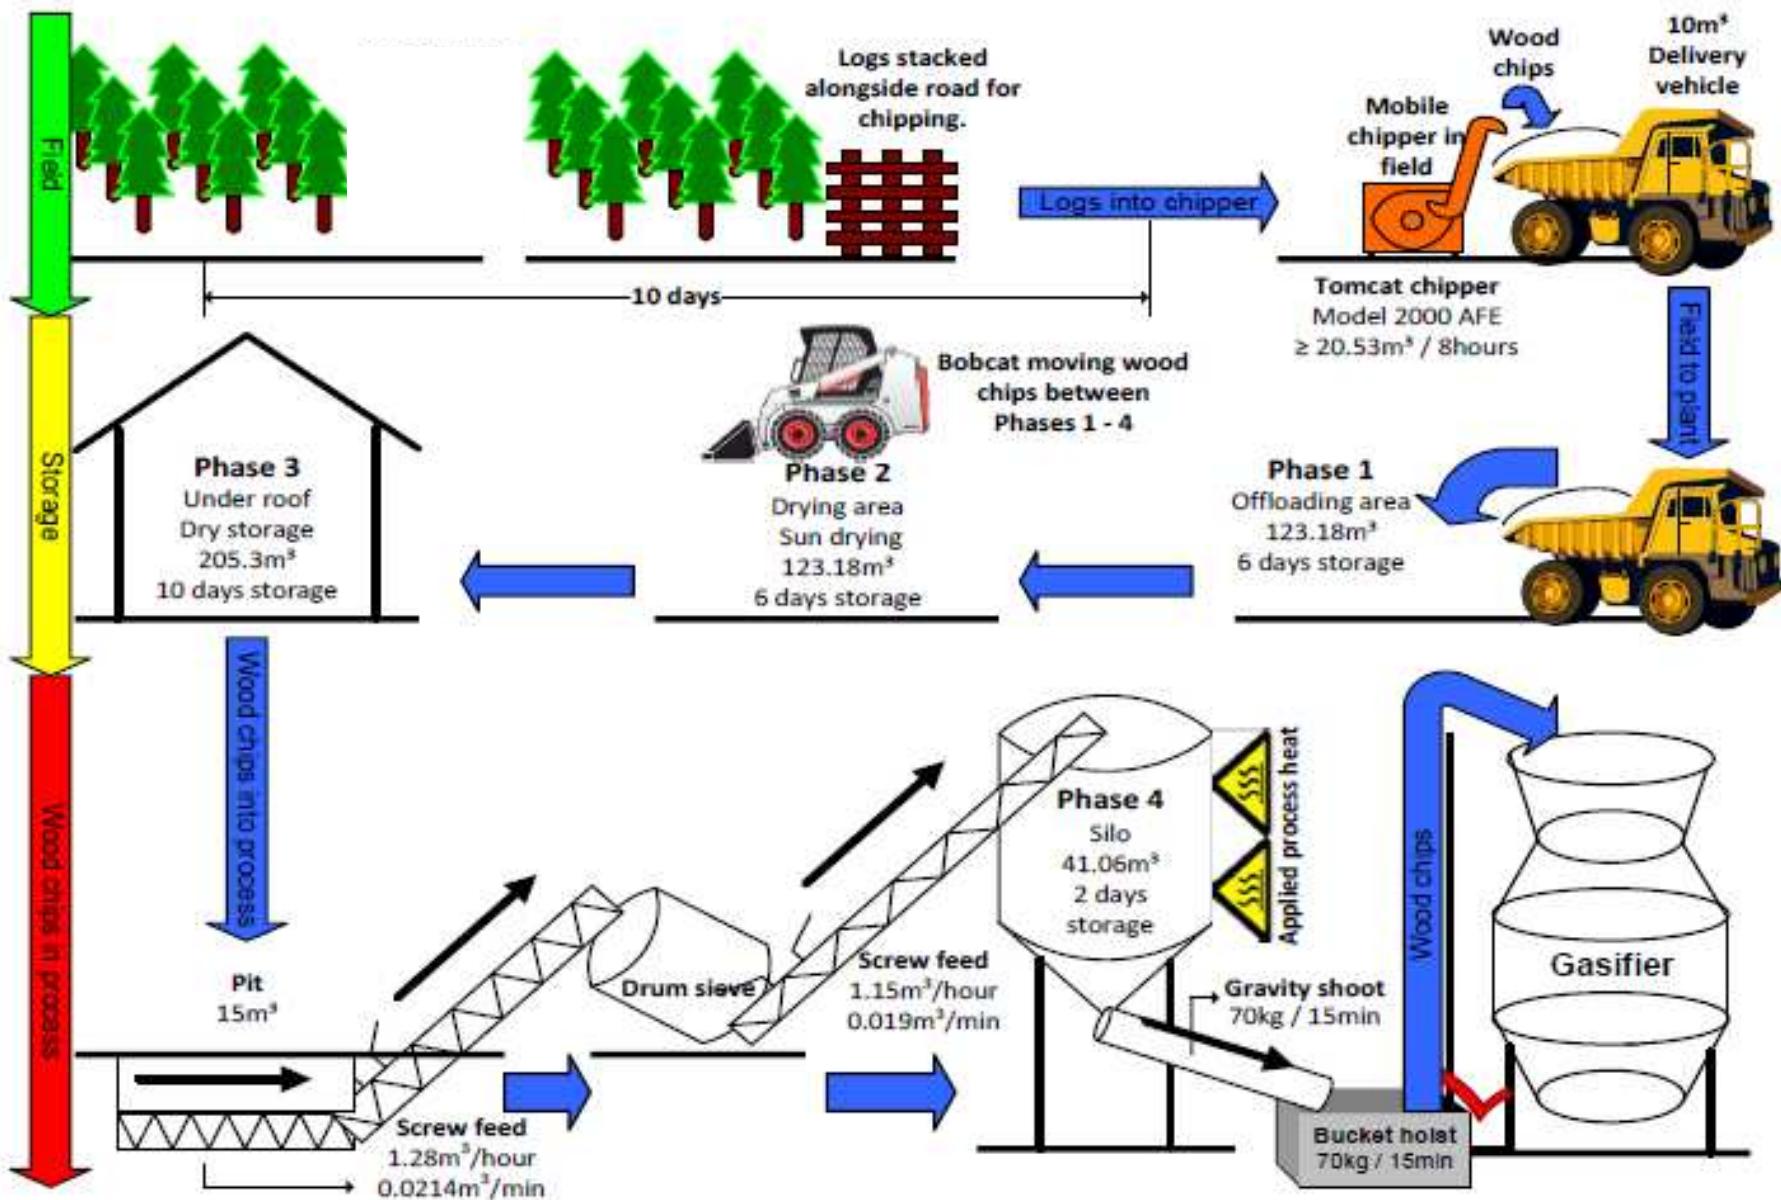

Output of Amabele Heat & Power

- Creation of 35 direct jobs;
- 250 kWh 'green;' electricity generation capacity for energy security of local agriprocessing;
- 430kWh thermal for local agri-processing enterprises;
- Biochar for local agriculture production.

Year	Cummulative Area Managed per Year (ha)					Biomass Yielded per annum (tons)				Biomass Totals		CHP Biomass fuel Req. (tons)	Berry support compost req. (tons)	Total Biomass Req. (tons)	Surplus for other markets (tons)	
	Wattle cleared	Wattle plantation	Gum Plantation Sustained	Gum Forest Sustained	Dry land Bamboo	Jungle Wattle	Plantation wattle	Gum Plantation Sustained	Gum Forest Sustained	Dryland bamboo	Per annum	Per Day

Yield Assumptions for Forest & Plantation Management												Assumptions for 250kWe CHP gassifier plant				
Jungle Wattle			40 tons/ha		Wattle Plantation every 10years			120 tons/ha of timber >80mm diam			Wattle fuel requirement for 250kW gassifi			320 kg /hour		
Sustained gum plantation			10 tons/ha/year		Wattle Plantation every 10years			24 tons/ha of brush <80mm diam			Supply contingency			15%		
Sustained gum forest			5 tons/ha/year		Dryland Bamboo (from year 7+)			40 tons/ha/year			Number of hours in operation			7885 hours/year		

Planning for long term feedstock security

Thank you
